

# ACKNOWLEDGEMENT

A successful project is a fruitful culmination of the efforts of many people. Some directly involved and others who have quietly encouraged and extended their invaluable support throughout its progress.

I would like to convey my heartfelt thanks to our **Management** for providing the good infrastructure, laboratory facility, qualified and inspiring staff whose guidance was of great help in successful completion of this project.

I extremely delightful and thankful to our beloved principal **Dr. K.E Prakash Principal and Director**, Shree Devi Institute of Technology, Kenjar for providing the congenial atmosphere and necessary facilities for achieving the cherished goal.

With heartiest gratitude, I would like to thank **Prof. Anand S Uppar**, HOD, Department of Computer Science and Engineering for his support, guidance and encouragement.

I are profoundly indebted to **Prof. Anand S Uppar**, Guide, HOD , Department of Computer Science and Engineering, for her guidance throughout the project work by innumerable acts of timely advice and encouragement.

I also thank all other teaching staff and non-teaching staff for allowing us to carry out the project work.

Finally, I would like to thank our family for their support and understanding, to whom we owe so much.

**DHEERAJ K P  
GAUTHAMI  
LATHEESH A M

# **ABSTRACT**

Casting a vote is not only the right of a citizen but also a responsibility of the citizen. The citizens of a country get an opportunity to vote for their representatives who will represent the needs and suggestions of citizens. These representatives are elected through the process called elections. The traditional electoral system necessitates the actual presence of the voter which causes discomfort to the physically challenged people. Also, there are chances of vote tampering. Our proposed solution is to use an Online Voting System using Ethereum Blockchain. This web-based voting system helps the voters to vote from any location. The system validates the voters with the help of their Aadhar cards linked with their voter id. After which the system requires the voters to scan their face and fingerprint which will be verified with the data in the database. Blockchain technology encrypts the vote and thus it prevents every vote from tampering. It makes sure that a voter can vote only once for one candidate. The system fetches the election results quickly and thus reduces the labour cost and counting errors.
